

TeaDecode

This function decrypts given base64 representation of encrypted data using the Tiny Encryption Algorithm.

Important Note: Use `decodeString` instead, because `teaEncode` inflates the file size by as high as ~77% (or by ~33% if the input isn't binary converted to base64 string).

Important Note: `teaDecode` cannot handle binary data.

Syntax

```
string teaDecode ( string data, string key )
```

Required Arguments

- **data:** The block of data you want to decrypt
- **key:** The key that should be used for decryption (Only first 16 characters are used)

Returns

Returns string containing the decrypted data if the decryption process was successfully completed, *false* otherwise.
