

# ExecuteBrowserJavascript

This function executes a Javascript string to the specified browser. Works only with local browsers.

## Syntax

```
bool executeBrowserJavascript ( browser webBrowser, string jsCode )
```

**OOP Syntax** Help! I don't understand this!

**Method:** *browser:executeJavascript(...)*

## Required Arguments

- **webBrowser:** The web browser which will execute the Javascript code
- **jsCode:** The Javascript code string

## Returns

Returns *true* if executing Javascript is allowed in the current context, *false* otherwise.
