

EngineGetModelNameFromID

This function gets the model name of an object model from model ID. This function is the counterpart of engineGetModelIDFromName.

Syntax

```
string engineGetModelNameFromID ( int modelID )
```

OOP Syntax Help! I don't understand this!

Method: *Engine.getModelNameFromID(...)*

Required Arguments

- **modelID:** The model ID of the object

Returns

Returns a *string* with the name of the object model, false otherwise.
