

Inspect

This function returns human-readable representations of tables and NRP datatypes as a string.

Syntax

```
string inspect ( mixed var [, table options] )
```

Required Arguments

- **var:** A variable of any datatype.
- **options:** A table of options. It is not mandatory, but when it is provided, it must be a table. For a list of options, see the Inspect's GitHub page.

Returns

Always returns a string. The contents can change if we update the inspect library, so it is not expected to be consistent across Lua versions.
