

StopResource

This function stops a running resource.

Note: This function does not stop the resource immediately, so don't expect that it starts stopping until the onResourceStop event for that resource is triggered. This happens after the scripts are done executing for this server frame.

Syntax

```
bool stopResource ( resource theResource )
```

OOP Syntax Help! I don't understand this!

Method: *resource:stop(...)*

Required Arguments

- **theResource:** the resource that should be stopped.

Returns

Returns *true* if the resource was stopped, *false* if the stopping failed, or an invalid resource was passed.
