

GetResourceExportedFunctions

Returns a table containing the names of the functions that a resource exports. It will return the exports of the current resource if there is no argument passed in.

Syntax

```
table getResourceExportedFunctions ( [ resource theResource = getThisResource( ) ] )
```

OOP Syntax Help! I don't understand this!

- Method:** *resource:getExportedFunctions(...)*
- Variable:** *.exportedFunctions*

Optional Arguments

- **theResource:** the resource of which you want to know the exported functions.

Returns

Returns a table of function names if successful, *false* otherwise.
