

GetAccount

This function returns an account for a specific user.

Syntax

```
account getAccount ( string username [, string password, bool caseSensitive = true ] )
```

OOP Syntax Help! I don't understand this!

Method: *Account(...)*

Required Arguments

- **username:** The username of the account you want to retrieve

Optional Arguments

NOTE: When using optional arguments, you might need to supply all arguments before the one you wish to use. For more information on optional arguments, see optional arguments.

- **password:** The password for the account. If this argument is not specified, you can get the account whatever password it is, otherwise the password must match the account's.
- **caseSensitive:** Specifies whether to ignore the case when searching for an account.

Returns

Returns an account or *false* if an account matching the username specified (and password, if specified) could not be found.
