

# GuiMemoSetCaretIndex

This function sets the current position of the caret (the text cursor) within the memo.

## Syntax

```
bool guiMemoSetCaretIndex ( gui-memo theMemo, int index )
```

**OOP Syntax** Help! I don't understand this!

**Method:** *GuiMemo:setCaretIndex(...)*

**Variable:** *.caretIndex*

**Counterpart:** *guiMemoGetCaretIndex*

## Required Arguments

- **theMemo:** The memo edit box where the caret position is to be changed.
- **index:** An integer referring to the desired character position within the box. 0 would be before the first character in the box, 1 before the second, etc.

## Returns

Returns *true* if the caret was successfully moved, *false* otherwise.
