

AclGet

Get the ACL with the given name. If need to get most of the ACL's, you should consider using `aclList` to get a table of them all.

Syntax

```
acl aclGet ( string aclName )
```

OOP Syntax Help! I don't understand this!

Note: *This function is a static function underneath the ACL class.*

Method: *ACL.get(...)*

Required Arguments

- **aclName:** The name to get the ACL belonging to

Returns

Returns the ACL with that name if it could be retrieved, *false/nil* if the ACL does not exist or it fails for some other reason.
