

[Shared function](#)

# XmlLoadString

This function creates an XmlNode from a string input.

## Syntax

```
XmlNode XmlLoadString ( string xmlString )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *This function is a static function underneath the XML class.*

**Method:** *XML.loadstring(...)*

## Required Arguments

- **xmlString:** A string containing XML data

## Returns

Returns the root XmlNode object of an xml string if successful, or *false* otherwise (invalid XML string).
