

GetElementChild

This function returns one of the child elements of a given parent element. The child element is selected by its index (0 for the first child, 1 for the second and so on).

Syntax

```
element getElementChild ( element parent, int index )
```

OOP Syntax Help! I don't understand this!

Method: *element:getChild(...)*

Required Arguments

- **parent:** the element above the one to be returned in the hierarchy.
- **index:** the element's index (0 for the first element, 1 for the second, etc).

Returns

Returns the requested element if it exists, or *false* if it doesn't.
