

FileGetPos

Returns the current read/write position in the given file.

Syntax

```
int fileGetPos ( file theFile )
```

OOP Syntax Help! I don't understand this!

Method: *file:getPos(...)*

Variable: *.pos*

Counterpart: *fileSetPos*

Required Arguments

- **theFile:** the file handle you wish to get the position of.

Returns

Returns the file position if successful, or *false* if an error occured (e.g. an invalid handle was passed).
