## Methods

### create

This is the default constructor for the Vector2 class and returns a Vector2 object.

### Syntax

```
vector2 Vector2 ( mixed vectorOrX [, float y ] )
```

### Required Arguments

- **vectorOrX**: Vector2, Table or Float indicating vector's coordinates

### Optional Arguments

- **y**: if *vectorOrX* is a float, this will indicate the vector's Y coordinate

### Example

This example checks if the player is using a low resolution.

```
client
```

```
addEventHandler ( "onClientResourceStart", resourceRoot, function()  
    local screenSize = Vector2(guiGetScreenSize())  
    if screenSize.x < 1360 and screenSize.y < 768 then  
        outputChatBox ("You are running on a low resolution")  
    end  
end)  
end)
```

### normalize

This function normalizes the vector

## Syntax

```
bool Vector2.normalize ( vector2 vector )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Normalizes a vector*

**Method:** *Vector2:normalize(...)*

## Required Arguments

- **vector:** Vector2 to normalize

## Example

This example demonstrates how to draw a line that is 200 pixels long and red. The line is drawn from the center of the screen to the mouse cursor's position.

```
client

local screenW, screenH = guiGetScreenSize() -- get screen size

local centerVec = Vector2(screenW / 2, screenH / 2) -- get screen center point
local mouseVec = Vector2() -- predefined variable that will change later

local lineLength = 200 -- sets length of the drawn line
local lineColor = tocolor(255, 0, 0) -- set line color

showCursor(true) -- show cursor

addEventHandler('onClientRender', root, function()
    local curX, curY = getCursorPosition()
    mouseVec.x, mouseVec.y = curX * screenW, curY * screenH -- get absolute cursor position

    local dVec = Vector2(mouseVec - centerVec) -- get the distance between the mouse position and the center of the screen
    local scaleFactor = lineLength / dVec.length

    mouseVec = centerVec + (dVec * scaleFactor)

    dxDrawLine(centerVec.x, centerVec.y, mouseVec.x, mouseVec.y, color)
end)
```

## getX

This function gets the X coordinate of a vector.

## Syntax

```
float Vector2.getX ( vector2 vector )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Gets X coordinate of a vector*

**Method:** *Vector2:getX(...)*

**Variable:** *.x*

## Required Arguments

- **vector:** Vector2 to get X coordinate from

## getY

This function gets the Y coordinate of a vector.

## Syntax

```
float Vector2.getY ( vector2 vector )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Gets Y coordinate of a vector*

**Method:** *Vector2:getY(...)*

**Variable:** *.y*

## Required Arguments

- **vector:** Vector2 to get Y coordinate from

## setX

This function sets the X coordinate of a vector.

## Syntax

```
bool Vector2.setX ( vector2 vector, float x )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Sets X coordinate of a vector*

**Method:** *Vector2:setX(...)*

**Variable:** *.x*

## Required Arguments

- **vector:** Vector2 to set X coordinate from
- **x:** New X coordinate

## setY

This function sets the Y coordinate of a vector.

## Syntax

```
bool Vector2.setY ( vector2 vector, float y )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Sets Y coordinate of a vector*

**Method:** *Vector2:setY(...)*

**Variable:** *.y*

## Required Arguments

- **vector:** Vector2 to set Y coordinate from
- **Y:** New Y coordinate

## getNormalized

This function gets a normalized vector.

## Syntax

```
vector2 Vector2.getNormalized ( vector2 vector )
```

**OOP Syntax** [Help! I don't understand this!](#)

**Note:** *Gets a normalized vector*

**Method:** *Vector2:getNormalized(...)*

**Variable:** *.normalized*

## Required Arguments

- **vector:** Vector2 to get normalized version of

## getLength

This function gets the length of a vector.

**Syntax**

```
vector2 Vector2.getLength ( vector2 vector )
```

**OOP Syntax** Help! I don't understand this!

- Note:** *Gets the length of a vector*
- Method:** *Vector2:getLength(...)*
- Variable:** *.length*

**Required Arguments**

- **vector:** Vector2 to get length from

**getSquaredLength**

This function gets the squared length of a vector.

**Syntax**

```
vector2 Vector2.getSquaredLength ( vector2 vector )
```

**OOP Syntax** Help! I don't understand this!

- Note:** *Gets the squared length of a vector*
- Method:** *Vector2:getSquaredLength(...)*
- Variable:** *.squaredLength*

**Required Arguments**

- **vector:** Vector2 to get squared length from

**dot**

This function gets the dot product of two vectors.

**Syntax**

```
vector2 Vector2.dot ( vector2 vectorOne, vector2 vectorTwo )
```

**OOP Syntax** Help! I don't understand this!

- Note:** *Gets the dot product of two vectors*
- Method:** *Vector2:dot(...)*

**Required Arguments**

- **vectorOne:** First Vector2 to calculate the dot product of
- **vectorTwo:** Second Vector2 to calculate the dot product of
