

AclGetRight

This function returns whether the access for the given right is set to true or false in the ACL.

Syntax

```
bool aclGetRight ( acl theAcl, string rightName )
```

OOP Syntax Help! I don't understand this!

Method: *acl:getRight(...)*

Counterpart: *aclSetRight*

Required Arguments

- **theAcl:** The ACL to get the right from
- **rightName:** The right name to return the access value of.

Returns

Returns *true* or *false* if the ACL gives access or not to the given function. Returns *nil* if it failed for some reason, e.g. an invalid ACL was specified or the right specified does not exist in the ACL.
