

GetResourceDynamicElementRoot

This function retrieves the *dynamic element root* of a specified resource. The *dynamic element root* is the parent of elements that are created by scripts (e.g. with `createObject`) unless they specify a different parent.

Syntax

```
element getResourceDynamicElementRoot ( resource theResource )
```

OOP Syntax Help! I don't understand this!

Method: *resource:getDynamicElementRoot(...)*

Variable: *.dynamicElementRoot*

Required Arguments

- **theResource:** the resource of which dynamic element root we want.

Returns

Returns an element of the resource's dynamic element root if the resource specified was valid and active (currently running), *false* otherwise.
