

GetPerformanceStats

This function returns performance information.

Syntax

```
table table getPerformanceStats ( string category [, string options = "", string filter = "" ] )
```

Required Arguments

- **category:** Performance statistics category. If empty string is given, list of all categories is returned. See categories for more information.

Optional Arguments

- **options:** Category specific ',' separated options. All categories supports 'h' option for help.
- **filter:** Case-sensitive filter used to select returned rows. Only 'name' column is filtered.

Returns

Returns two tables. First contains column names. The second contains result rows. Each row is table of cells.
