

GetAccountsByData

ADDED/UPDATED IN VERSION 1.5.5 r11747:

This function returns a table containing all accounts with specified dataName and value (set with setAccountData).

Syntax

table getAccountsByData (string dataName, string value)

OOP Syntax Help! I don't understand this!

Note: *This function is a static function underneath the Account class.*
Method: *Account.getAllByData(...)*

Required Arguments

- **dataName:** The name of the data
- **value:** The value the dataName should have

Returns

Returns *table* containing the accounts associated with specified value at dataName. Returns *false* if invalid arguments were specified.
