

SetBrowserRenderingPaused

This function sets the rendering state of a browser.

Warning: May cause issues with browser rendering on PC with low Ram #1567. It's might be better to completely release browser, instead of pausing it, when its not needed.

Syntax

```
bool setBrowserRenderingPaused ( browser webBrowser, bool paused )
```

OOP Syntax Help! I don't understand this!

Method: *browser:setRenderingPaused(...)*

Variable: *.renderingPaused*

Counterpart: *isBrowserRenderingPaused*

Required Arguments

- **webBrowser:** The browser
- **paused:** *true* to pause rendering, *false* to continue

Returns

Returns *true* if the state was successfully changed
