

OnResourceStart

This event is triggered when a resource is started.

Important: If you attach this event to the root element it will be called when *any* resource starts, not just the resource your script is running inside. As such, most of the time you will want to check that the resource passed to this event matches your resource (compare with the value returned by `getThisResource` before doing anything. Alternatively you can attach the event to `resourceRoot`.

Parameters

`resource` `startedResource`

- **startedResource:** the resource that was started.

Source

The source of this event is the root element in the resource that started.

Cancel effect

If this event is canceled, the resource starting is aborted and is stopped again.
