

Utf8.insert

Inserts a substring into input string. If insert-position is given, the substring will be inserted before the character at this index, otherwise the substring will concatenate to input. The insert position may be negative.

Syntax

```
string utf8.insert ( string input [, int insert_pos = utf8.len( input ) + 1 ], string substring )
```

Required Arguments

- **input:** A string character sequence
- **substring:** A string character sequence which should be inserted

Optional Arguments

NOTE: When using optional arguments, you might need to supply all arguments before the one you wish to use. For more information on optional arguments, see optional arguments.

- **insert_pos:** An integer representing the position, where the substring will be inserted at.

Returns

Returns a *string* with the inserted substring value.
