

# GetElementByIndex

**Important Note:** If you wish to retrieve more than one element at a time, it is more efficient to use `getElementsByType` instead.

This function returns an element of the specified type with the specified index.

## Syntax

```
element getElementByIndex ( string theType, int index )
```

**OOP Syntax** Help! I don't understand this!

**Note:** *This function is a static function inside the `Element` class.*

**Method:** *`Element.getByIndex(...)`*

## Required Arguments

- **theType:** the type of the element to be returned. Examples include "player", "vehicle", or a custom type.
- **index:** the element's index (0 for the first element, 1 for the second, etc).

## Returns

Returns the requested element, or *false* if it doesn't exist.
