

Client-side function

IsTransferBoxActive

This function returns whether the file downloading dialog box is active or not. This appears when a resource is started and the client doesn't have all the files that resource requires the client to have.

It's important to note that resources aren't started on the client until they're completely downloaded, so a resource cannot use this function to detect if it's own files are downloaded. A client-side resource triggers the `onClientResourceStart` event when the files it requires are downloaded.

Syntax

```
bool isTransferBoxActive ()
```

OOP Syntax [Help! I don't understand this!](#)

Method: *GuiElement.isTransferBoxActive(...)*

Returns

Returns *true* if the file transfer box is visible, *false* if not.
