

HttpWrite

This function adds text to the output of the current HTTP file of the HTTP interface. The function can only be used on parsed (i.e not marked as *raw*) HTTP pages. `httpWrite` can support outputting binary data, if you specify the length of the data you are outtputing. If you do this, you should ensure you set an accurate content-type using `httpSetResponseHeader` otherwise it may be displayed inconsistently by browsers.

Syntax

```
bool httpWrite ( string data [, int length] )
```

Shortcut syntax

The following shortcut syntax is also supported (the space between the `<*` and the `=` is optional):

```
[html]
<* = text *>
```

which is equivalent to:

```
[html]
<* httpWrite(text) *>
```

Required Arguments

- **data:** the data to be added to the page's output.

Optional Arguments

- **length:** The length of the data being written. Generally only should be required for writing binary data.

Returns

Returns *true* if the text was added to the output buffer successfully, *false* otherwise.
