

SetElementID

This function sets the ID of an element to a string. This can be anything from an identifying number, to a name. You can only change the ID of an element clientside if that element has been created clientside as well.

Syntax

```
bool setElementID ( element theElement, string name )
```

OOP Syntax Help! I don't understand this!

Method: *element:setID(...)*

Variable: *.id*

Counterpart: *getElementID*

Required Arguments

- **theElement:** The element you want to set the ID of.
- **name:** The new ID for theElement.

Returns

This returns *true* if successful. It will return *false* if **theElement** is invalid, or does not exist, or if **name** is invalid, or is not a string.
