

GetElementChildrenCount

This function returns the number of children an element has. Note that only the direct children are counted and not elements that are further down the element tree.

Syntax

```
int getElementChildrenCount ( element parent )
```

OOP Syntax Help! I don't understand this!

Method: *element:getChildrenCount(...)*

Required Arguments

- **parent:** the parent element

Returns

Returns an *int* with the number of child elements, or *false* if the parent element does not exist.
