

# OnElementModelChange

This event is triggered when the model of an element is changed using `setElementModel`.

## Parameters

`int oldModel`, `int newModel`

- **oldModel:** an int representing the model of the element before the change occurred.
- **newModel:** an int representing the new model of the element.

## Source

The source of this event is the element that changed its model

## Cancel effect

This event does NOT support cancellation. Use `setElementModel` with the old value to reverse.
