

XmlNodeGetAttributes

Returns all the attributes of a specific XML node.

Syntax

table XmlNodeGetAttributes (xmlnode node)

OOP Syntax Help! I don't understand this!

Method: *xmlnode:getAttributes(...)*

Variable: *.attributes*

Required Arguments

- **node:** the XML node to get the attributes of.

Returns

If successful, returns a table with as keys the names of the attributes and as values the corresponding attribute values. If the node has no attributes, returns an empty table. In case of failure, returns *false*.
