

Iprint

This function intelligently outputs debug messages into the Debug Console. It is similar to `outputDebugString`, but outputs useful information for **any** variable type, and does not require use of Lua's `tostring`. This includes information about element types, and table structures. It is especially useful for quick debug tasks.

Syntax

```
bool iprint ( mixed var1[, mixed var2, mixed var3...] )
```

Required Arguments

- **var1**: A variable of any type to print intelligent information for.

Optional Arguments

NOTE: When using optional arguments, you might need to supply all arguments before the one you wish to use. For more information on optional arguments, see [optional arguments](#).

- **var2+**: Another variable to be output. An unlimited number of arguments can be supplied

Returns

Always returns *nil*.

Issues

If one of the arguments is `nil`, any arguments after it will not appear.
