

# LoadMapData

This function is intended to load data from a loaded XML file into the element tree. This could be used for loading an external map, or part of another map.

## Syntax

element loadMapData ( xmlnode node, element parent )

## Required Arguments

- **node:** The node that you wish to load into the element tree.
- **parent:** The node you wish to be the parent of the new map data.

## Returns

Returns an element object that corresponds to the root of the new data added, i.e. an element that represents the *node* xmlnode passed to the function. Returns *false* if the arguments are invalid.
