

GetServerConfigSetting

This function retrieves server settings which are usually stored in the **nrpserver.conf** file.

Available in 1.1 and onwards

Syntax

```
mixed getServerConfigSetting ( string name )
```

Required Arguments

- **name** : The name of the setting (setting names can be found [here](#))

Returns

Returns a string containing the current value for the named setting, *table* if **name** is **module** or *false* if the setting does not exist.

If the setting name is *serverip*, may return the string *"auto"* on local servers.
