

GetResourceMapRootElement

This function retrieves the root element of a certain map in a specified resource.

Syntax

```
element getResourceMapRootElement ( resource theResource, string mapName )
```

OOP Syntax Help! I don't understand this!

Method: *resource:getMapRootElement(...)*

Required Arguments

- **theResource:** the resource where the map is located
- **mapName:** name of the maps which root element we want to retrieve, file extension is required

Returns

Returns an the resource's map root element if the map exists and resource specified was valid and active (currently running), *false* otherwise.
