

Shared function

SetElementCallPropagationEnabled

This function enables/disables call propagation on a certain element. Look at the example for a practical application.

Syntax

```
bool setElementCallPropagationEnabled ( element theElement, bool enabled )
```

OOP Syntax Help! I don't understand this!

Method: *element:setCallPropagationEnabled(...)*

Required Arguments

- **theElement:** The element whose propagation behaviour you'd like to change
- **enabled:** Whether propagation should be enabled or not

Returns

Returns *true*, if the propagation behaviour has been changed successfully, *false* otherwise.
