XmlNodeGetAttribute

This function is used to return an attribute of a node in a configuration file.

Syntax

```
string xmlNodeGetAttribute ( xmlnode node, string name )
```

OOP Syntax Help! I don't understand this!

> **Method**: *xmlnode:getAttribute(...)*
> **Counterpart**: *xmlNodeSetAttribute*

Required Arguments

- **node:** The node from which you wish to return the attribute
- **name:** The name of the attribute.

Returns

Returns the attribute in string form or *false*, if the attribute is not defined.
