GetColPolygonPoints

This function is used to get all bound points in a colshape polygon.

Syntax

```
table getColPolygonPoints ( colshape shape )
```

OOP Syntax Help! I don't understand this!

> **Method**: *colshape:getPoints(...)*

Required Arguments

* **shape:** The colshape polygon you wish to get the points of.

Returns

Returns a table of coordinates, each coordinate being a table containing the x and y position of a bound point, *false* if invalid arguments were passed.
