# SetBrowserProperty

This function sets a given property of a specified browser.

## Syntax

```
bool setBrowserProperty ( browser theBrowser, string key, string value )
```

**OOP Syntax** Help! I don't understand this!

> **Method**: *browser:setProperty(...)*
> **Counterpart**: *getBrowserProperty*

### Required arguments

- **theBrowser:** The browser element you want to set a property of
- **key:** The browser property key. It can be:
    - **mobile:** Surfing the web as mobile
- **value:** A value indicating whether to enable ("1") the property or not ("0")

### Returns

Returns *true* if the property was successfully set, *false* otherwise.
