RemoveColPolygonPoint

This function is used to remove a point from an existing colshape polygon.

Syntax

```
bool removeColPolygonPoint ( colshape shape, int index )
```

OOP Syntax Help! I don't understand this!

> **Method**: *colshape:removePoint(...)*
> **Counterpart**: *addColPolygonPoint*

Required Arguments

- **shape:** The colshape polygon you wish to remove a point from.
- **index:** The index of the point you wish to remove. The points are indexed in order, with 1 being the first bound point. You can't remove the last 3 points.

Returns

Returns *true* if the polygon was changed, *false* if invalid arguments were passed.
