XmlCreateChild

This function creates a new child node under an XML node.

Syntax

```
xmlnode xmlCreateChild ( xmlnode parentNode, string tagName )
```

OOP Syntax Help! I don't understand this!

> **Method**: *xmlnode:createChild(...)*

Required Arguments

- **parentNode:** the xmlnode you want to create a new child node under.
- **tagName:** the type of the child node that will be created.

Returns

Returns the created xmlnode if successful, *false* otherwise.
