GetResourceConfig

This function is used to return the root node of a configuration file. Config files must be predefined in a resource's meta file. An alternative way to load XML files is to use xmlLoadFile.

Syntax

```
xmlnode getResourceConfig ( string filePath )
```

Required Arguments

- **filePath:** The filepath of the file in the following format: **":resourceName/path"**. 'resourceName' is the name of the resource the file is in, and 'path' is the path from the root directory of the resource to the file.

  For example, if there is a file named 'settings.xml' in the resource 'ctf', it can be accessed from another resource this way: *getResourceConfig(":ctf/settings.xml")*.
  If the file is in the current resource, only the file path is necessary, e.g. *getResourceConfig("settings.xml")*.

Returns

Returns the root node of the specified configuration file. If the file is corrupted, not defined in the meta file or doesn't exist, returns false.
