RequestBrowserDomains

This function opens a request window in order to accept the requested remote URLs.

> **Note:** You must use this function prior to calling loadBrowserURL because every domain, with exceptions in the whitelist here and there, is blocked by default.

Syntax

```
bool requestBrowserDomains ( table pages [, bool parseAsURL = false, function callback ] )
```

OOP Syntax Help! I don't understand this!

> **Method**: *Browser.requestDomains(...)*

Required Arguments

- **pages:** A table containing all domains

Optional Arguments

- **parseAsURL:** *true* if the passed addresses should be converted from URLs, *false* otherwise.
- **callback:** A callback function that is called as soon as the result is available

Syntax:

```
function(bool wasAccepted, table new_domains)
```

Returns

Returns **true**, if the string was successfully read, **false** otherwise.
