# OnResourceStop

This event is triggered when the resource is stopped. This can occur for a number of reasons:

- The *stop* console command was used
- The *restart* console command was used
- The resource was modified (the resource will automatically restart)
- Another resource stopped it using stopResource.

**Note:** If you wish to just detect a single resource being stopped, you should attach handlers for this event to the resource's root element. You can access this using getResourceRootElement.

## Parameters

```
resource stoppedResource, boolean wasDeleted
```

- **stoppedResource**: the resource that is being stopped.
- **wasDeleted**: a boolean representing whether the resource folder was deleted, moved or renamed.

## Source

The source of this event is the root element of the resource that is being stopped.
